JHALDDRY GONZÁLEZ

Full Stack Developer

Maturín, Venezuela · jhalddryg@gmail.com · linkedin.com/in/jhalddry · github.com/Jhalddry

PROFILE

Self-taught full stack developer with 2+ years of professional work on web and mobile products for enterprise and SaaS clients. Most of that work sits where a product meets someone else's system: payroll and revenue provider integrations, real-time video and chat, and LLM features running in production. Currently the primary developer on a client product, and the sole developer of a shipped mobile app.

EXPERIENCE

Yisrael Tech

Software Developer · Oct 2024 – Present

Labor Lens — Primary Developer — Jan 2026 – Present

- Built two payroll provider integrations end to end (Paychex, Finch), covering encrypted credential storage, multi-company org discovery, mapping UI and automated sync. Batching cut Finch pay-statement retrieval from N API requests to one.
- Owner of the pay-period engine behind all revenue and labor reporting: generation, semi-monthly and bi-weekly cadences, per-location periods, a ±3-day edit rule, archive instead of delete.
- Killed the recurring serverless timeouts in a nine-job scheduled sync layer with time-budgeted loops and stale-lock recovery.
- Reconciled synced revenue against the vendor's own report, and unified a labor-cost formula that three reporting surfaces had been calculating differently. 351 commits in 9 months, highest-volume contributor on a six-person team (~3x the next engineer).

Stack: Next.js 15, React 19, TypeScript, Supabase/PostgreSQL, Tailwind, TanStack Query, Vercel Cron, AWS S3

Vera — Full Stack Developer — 2026

- Zero Tickets, a live customer-support system built from scratch: SQL schema, separate client and agent APIs, embedded widget, agent console, FIFO queue with auto-close, one-click screen capture, and an authorization model that no longer piggybacked on platform admin roles.
- Added peer-to-peer video calling on top of it with WebRTC: custom REST signaling, Cloudflare TURN, recording persisted to S3. The hard part was the failures. Calls died on navigation until the connection moved to a single global owner, and negotiation went stale under React Strict Mode.
- Shipped a read-only Model Context Protocol server exposing seven tools behind API-key authentication, then closed five security findings with measured before and after results, among them a timing attack and an API-key prefix collision.
- Traced a support chat taking over 100 seconds to load back to four independent root causes and fixed all four in one pass. Wrote 16 unit test suites covering guards, parsers and HTTP clients.

Stack: Next.js 15, React 19, TypeScript, PostgreSQL, Drizzle ORM, WebRTC, AWS S3/SNS, Vitest

School CRM — Full Stack Developer — Jul – Sep 2026

- Built the generative-AI layer of an existing multi-vertical CRM for three domains: conversational flows, forms and Kanban boards. Per-node Zod schemas, context injection so the model cannot invent identifiers, and sanitizers that validate every LLM output before it persists.
- Brought Instagram to parity with WhatsApp by modeling Meta's 24-hour messaging policy in the domain itself. Also duplicate-prospect detection, role-derived authorization, and backend pagination for tables that stalled past 200 records.

Stack: Next.js 16, React 19, MongoDB/Mongoose, Vercel AI SDK (Gemini), WhatsApp Cloud API, Instagram Messaging API, MUI

DNK — Software Developer · enterprise engagement delivered with Nerdery (US) — Oct 2024 – Dec 2025

- Built pages and features from Figma designs, integrated REST APIs and services, and created and modified backend endpoints across a multi-module enterprise application. Frontend and backend in .NET/C#, alongside a US-based engineering team. *Private client project.*

SELECTED PROJECT

La Cancha — sports matchmaking app (iOS & Android) · solo developer — May – Jun 2026

- Designed, built and shipped alone in five weeks: 32 screens, 44 reusable components, ~27,000 lines of strict TypeScript, and a custom design system with dark and light themes.
- Real-time chat with read receipts, typing indicators and unread counts over Supabase Realtime, including the races between optimistic UI state and database commits.
- Modeled the PostgreSQL schema in 38 idempotent migrations, with Row Level Security on every table, SECURITY DEFINER RPCs for controlled escalation, and triggers that derive reputation and badges with no application code.

Stack: React Native, Expo SDK 54, TypeScript, Supabase

TECHNICAL SKILLS

Programming — TypeScript, JavaScript, C#, SQL, HTML/CSS
Frontend — React, Next.js (App Router), React Native, Expo, Tailwind CSS, MUI, TanStack Query, Zustand
Backend & Data — Node.js, .NET/C#, REST APIs, PostgreSQL, Supabase, MongoDB, Drizzle ORM, SQL migrations, WebRTC, Vitest
Cloud & Integrations — Vercel, AWS S3/SNS, Paychex, Finch, WhatsApp Cloud API, Instagram Messaging API, Vercel AI SDK, MCP
AI Development Tools — Claude Code, ChatGPT, Gemini, Lovable; spec and implementation plan written before the code, audit after
Languages — Spanish (native) · English (professional working proficiency)

CERTIFICATIONS

Udemy — JavaScript · React · Next.js
